

# Switches

Switches are a great and necessary thing for a network, but for VOIP they require special consideration.

## Unmanaged Switches

Unmanaged switches (or dumb switches) are the easiest to use with VOIP systems, as they require no special settings or configuration.

We recommend that you avoid 4 or 5 port switches in favor of 8+ ports, as the 4 and 5 port switches are generally low quality and less reliable.

Most unmanaged 8+ port switches can be had for \$20-30.

**Please note** - *Managed switches that are not managed are not the same thing as an unmanaged switch.*

## Managed Switches

Managed switches require proper configuration to work with VOIP systems.

**Please note** - *an unconfigured managed switch is not the same as an unmanaged switch.*

- *If using a managed switch, you will need an IT person.*
